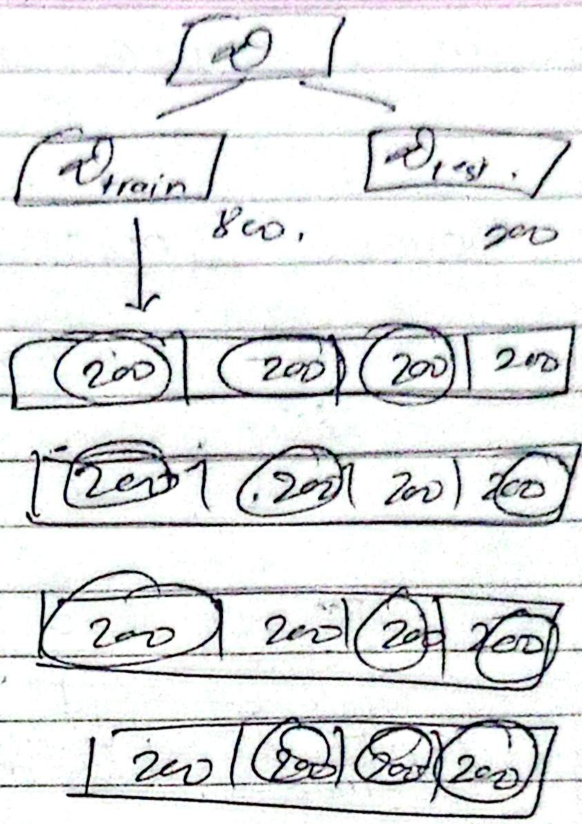
K-Fold approach:

1000 rows.



K defines in how many boxes, do you want to divide data equally.

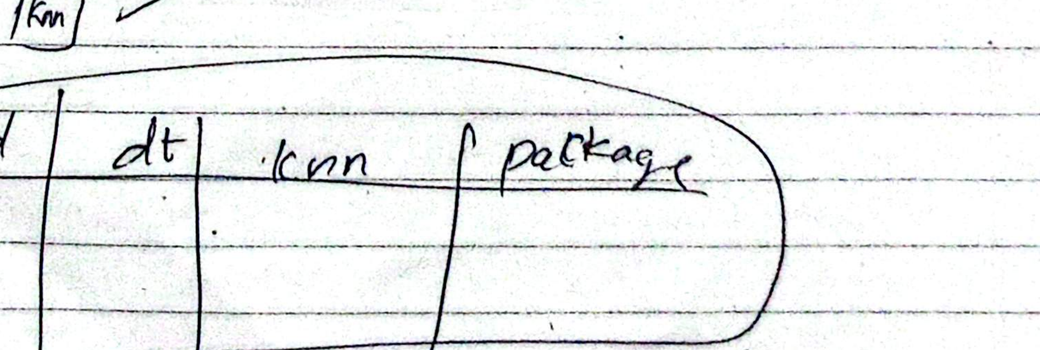
Step 1:

same base model (lr)

train base model by data 200

& $\boxed{\ }$ is used for prediction. (total 800 students)

Do same for ~~lr~~, dt, knn.



lr_pred	dt	knn	package

(800, 4)

800 rows.

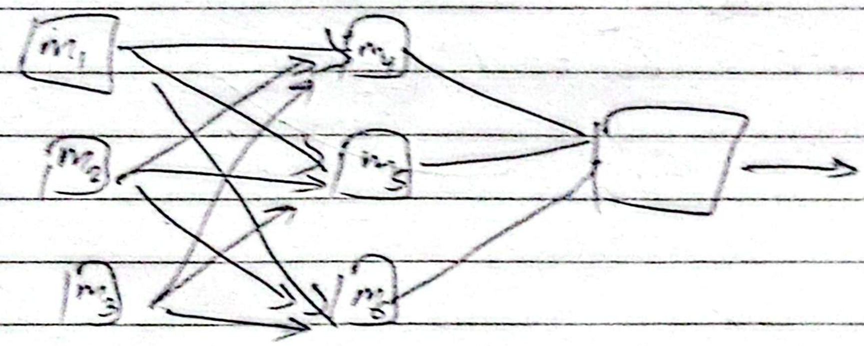
Page No.
Date / /

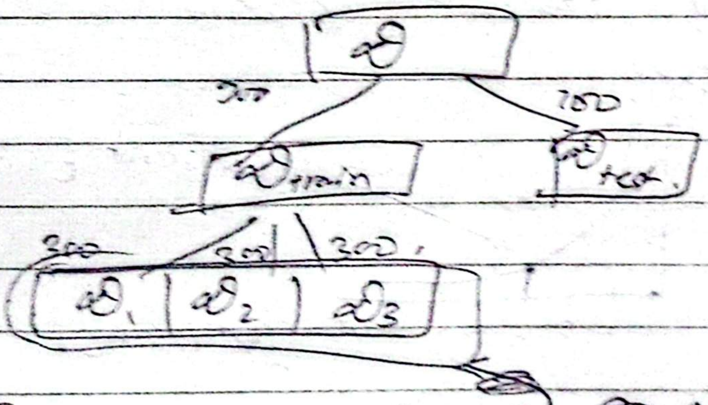
Step3:
- Here we get metamodel 1st, then later base model.

Step4: Retrain X_train, Y_train.

Now, predict:

Multi-layer stacking:





k = 3

Train m_1, m_2 & m_3 in D_1 & pred in ~~train in~~ D_2.

then now: output table m1_pred, m2_pred, m3_pred.

Then train this in m_4, m_5, m_6, then run m4, m5, m6 in D_3 → then give to metamodel
