Ensemble Learning:

combining multiple machine learning models to make big model [remove noise from multiple ~~data~~ model and give best]

- reduce bias, variance

disadvantage
↳ increase complexities.

Always use it.

Wisdom of the Crowd:

~~Pa~~ Start:

training & prediction.

Prediction:

m_1 - m_2 m_3 - - - m_n

a) ~~Pa~~ these models should be different.

b) algorithm same but different ~~training~~ data given.

c) ~~both~~ combo of both (a) and (b)

- Classification:

Here majority count wins..

3 model → yes } then it will be yes.
2 model → no

- Regression:

average (mean value)
