

XG Boost

Page No.

Date: / /

↓
not an algorithm, it is a library based on Gradient Boosting.

- Gradient Boosting.
 - Can use any loss fⁿ (need to be differentiable)
 - High performance.
- GB doesn't perform well in the bigger dataset.
So ~~to~~ increase the performance in higher dataset.
- XG Boost is ~~etc~~ as flexible:
 - Cross platform (Linux, Windows)
 - Multiple Language Support (Python, R, Java)
 - Support all kind of ML Problems.
 - Integration with other libraries and tools.

b) Speed

- Parallel processing in making decision tree (not diff model coz we have to pass the error of previous model)
- Optimized data structure.
 - store data in column block not in row block.
